Introduction Microsoft Office  
2003 Research Service is a feature  
of the Microsoft Office 2003  
Office Suite that provides a web  
interface for submitting queries of  
documents to content management

---

repositories and retrieval of documents based on specified queries. Content management repositories that are used by the Microsoft Office 2003 Research Service include Microsoft Office SharePoint Server, Microsoft Office OneNote Server, and Microsoft Office SkyDrive. Using the Microsoft Office 2003 Research Service, you can create services for querying content in these repositories. A service can be defined to return information by either searching for content in the repository, or by using queries specified in a document that includes the service. Microsoft Office 2003 Research Service provides the following online services: \* Document search using

---

the Document Id, Keyword, and Lucene query syntax. \* Document history service for versioning. \* Document comparison service. The Document comparison service makes it easy to find changes between two versions of a document. The comparison service includes the ability to compare specific document parts, such as text in a specific format. The Document search service makes it easy to search for specific content in a repository, such as a document. Search results are returned with ranking scores. Ranking scores are used to prioritize the search results returned. The Document history service makes it easy to track document versions through a

---

repository. Two types of sample services are provided in the Microsoft Office 2003 Research Service SDK. These services are described in more detail later in this document 81e310abbf

The Microsoft Office 2003 Research Service SDK (Service Software Development Kit) provides you with a set of Web methods for developing information services that are searchable with the Microsoft Office 2003 Research feature. This guide provides detailed instructions on how to install and configure a Windows Server 2003 network. It covers a comprehensive introduction to installing and configuring Windows Server 2003 on a Windows Server 2003 system, and includes detailed information on how to configure your network. It also shows you how to configure

web service methods that are similar to the previously available Microsoft Office 2000 Research Service SDK. The Microsoft Office 2003 Research Service SDK allows you to integrate new search capabilities into applications and Web sites, such as search within Microsoft Office 2003, to retrieve content from different sources, to determine the origin of the information, and to query the information without an Internet connection. This is the SDK topic for the Microsoft Office 2003 Research Service SDK. The SDK topic provides information about the Microsoft Office 2003 Research Service SDK and the other topics listed in this section. This topic covers the

web service methods available in the Microsoft Office 2003 Research Service SDK. The API topic covers the API methods available in the Microsoft Office 2003 Research Service SDK. A user interface controls the behavior of an information service application. The user interface typically consists of one or more input boxes, drop-down lists, and buttons. A data access library provides a programmatic interface to a database. The data access library is used to define access methods for applications. In this section, you can learn more about the user interface and data access libraries that are available for the Microsoft Office 2003 Research Service SDK. For more
